

MSCB advantages and PSI specific implementations

Stefan Ritt

Paul Scherrer Institute, Switzerland

Slow Control = DAQ at 10ms ... 10s

- Temperatures, Pressures, High Voltages, ...

MSCB

- Midas Slow Control Bus
- Developed at PSI since 2001 mainly for MEG

This Talk

- Short introduction
- Specific hardware solutions
- Software overview (LabView)
- “Informal” talk: Ask questions, start discussion

- Search for $\mu \rightarrow e \gamma$ down to 10^{-13}
- 80 People, 11 MCAD
- R & D started in 2000, data taking in 2007-2010
- Complex detector system (liquid Xenon calorimeter, superconducting magnets)
- Long term stability

→ **Demanding slow control system**

Beam line magnet

- 2 valves, 10 temperature sensors
- communication with LHe plant and quench control (24V signals)

COBRA Magnet

- 40 temperature sensors, communication with quench control (GPIB)

Beamline

- 14 magnets (EPICS-like)

NaI mover

- Two ultrasonic stepping motors

LXe system

- ~100 valves, flow meters, pressure sensors
- Capacitive level meters

DC gas system

- Similar to TWIST (~1Pa diff. pressure regulation)

High Voltage

- 1000 channels PMT
- 32 channels drift chamber

Air conditioning

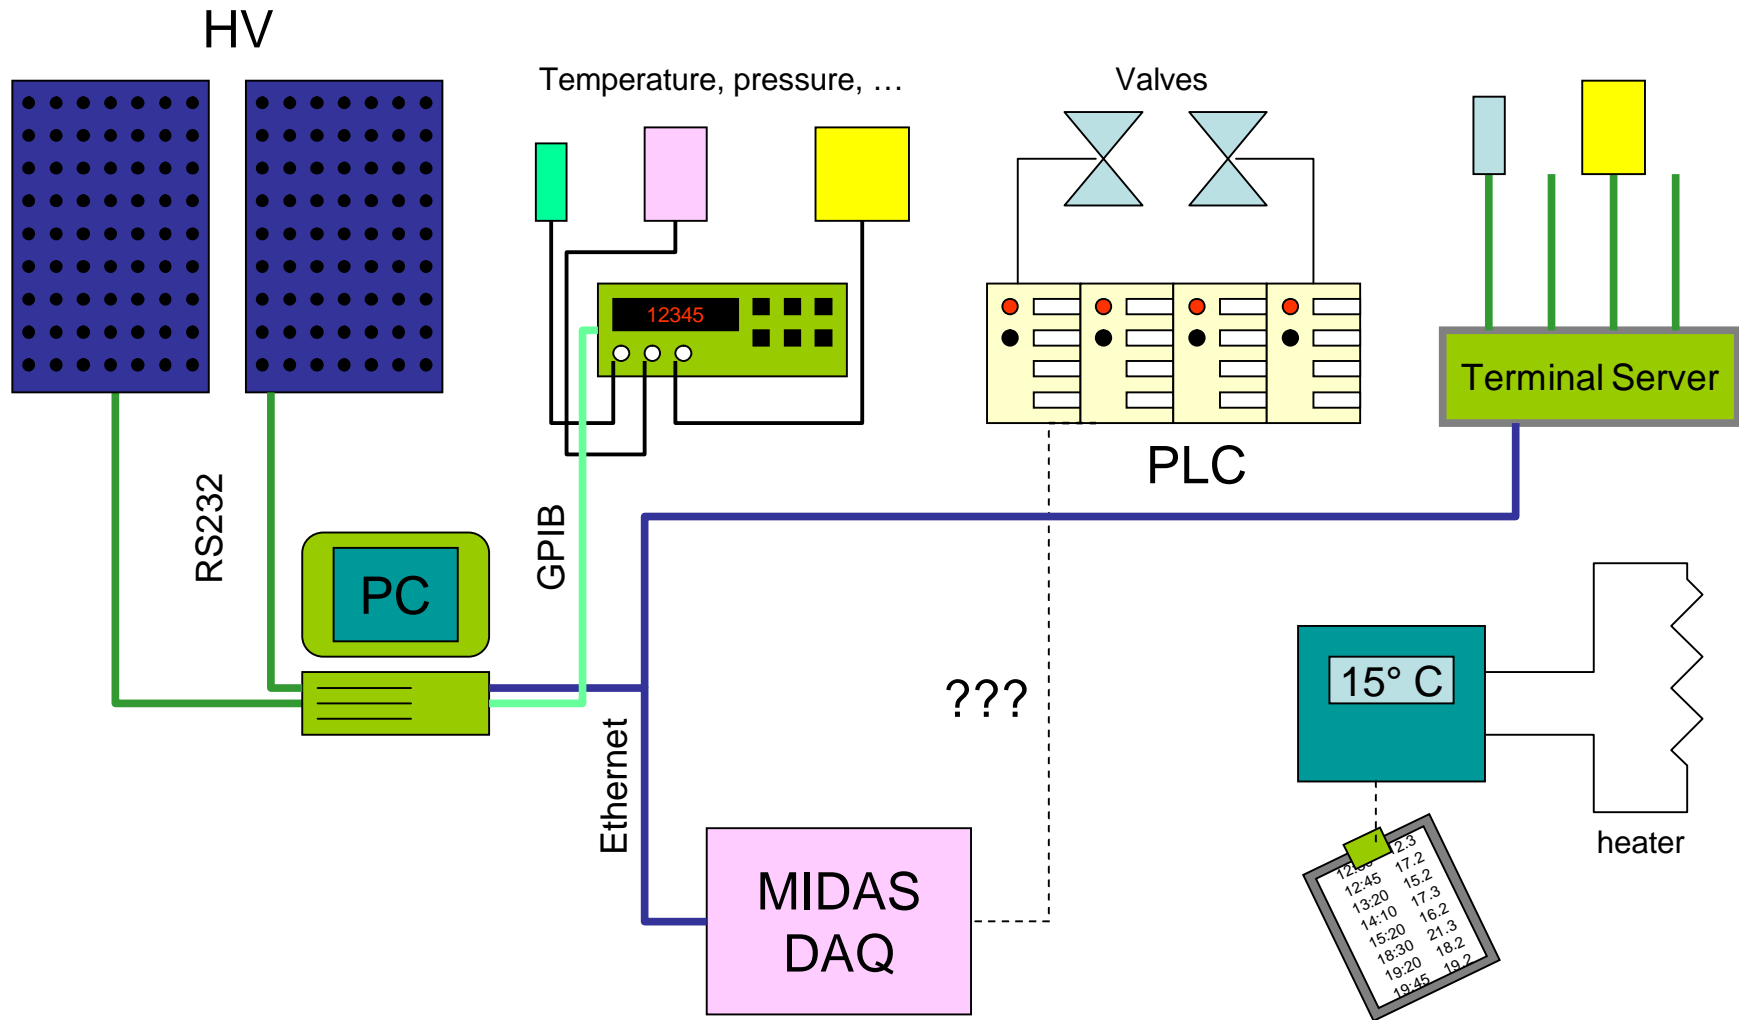

VME crates

- Fans, voltages, temperatures

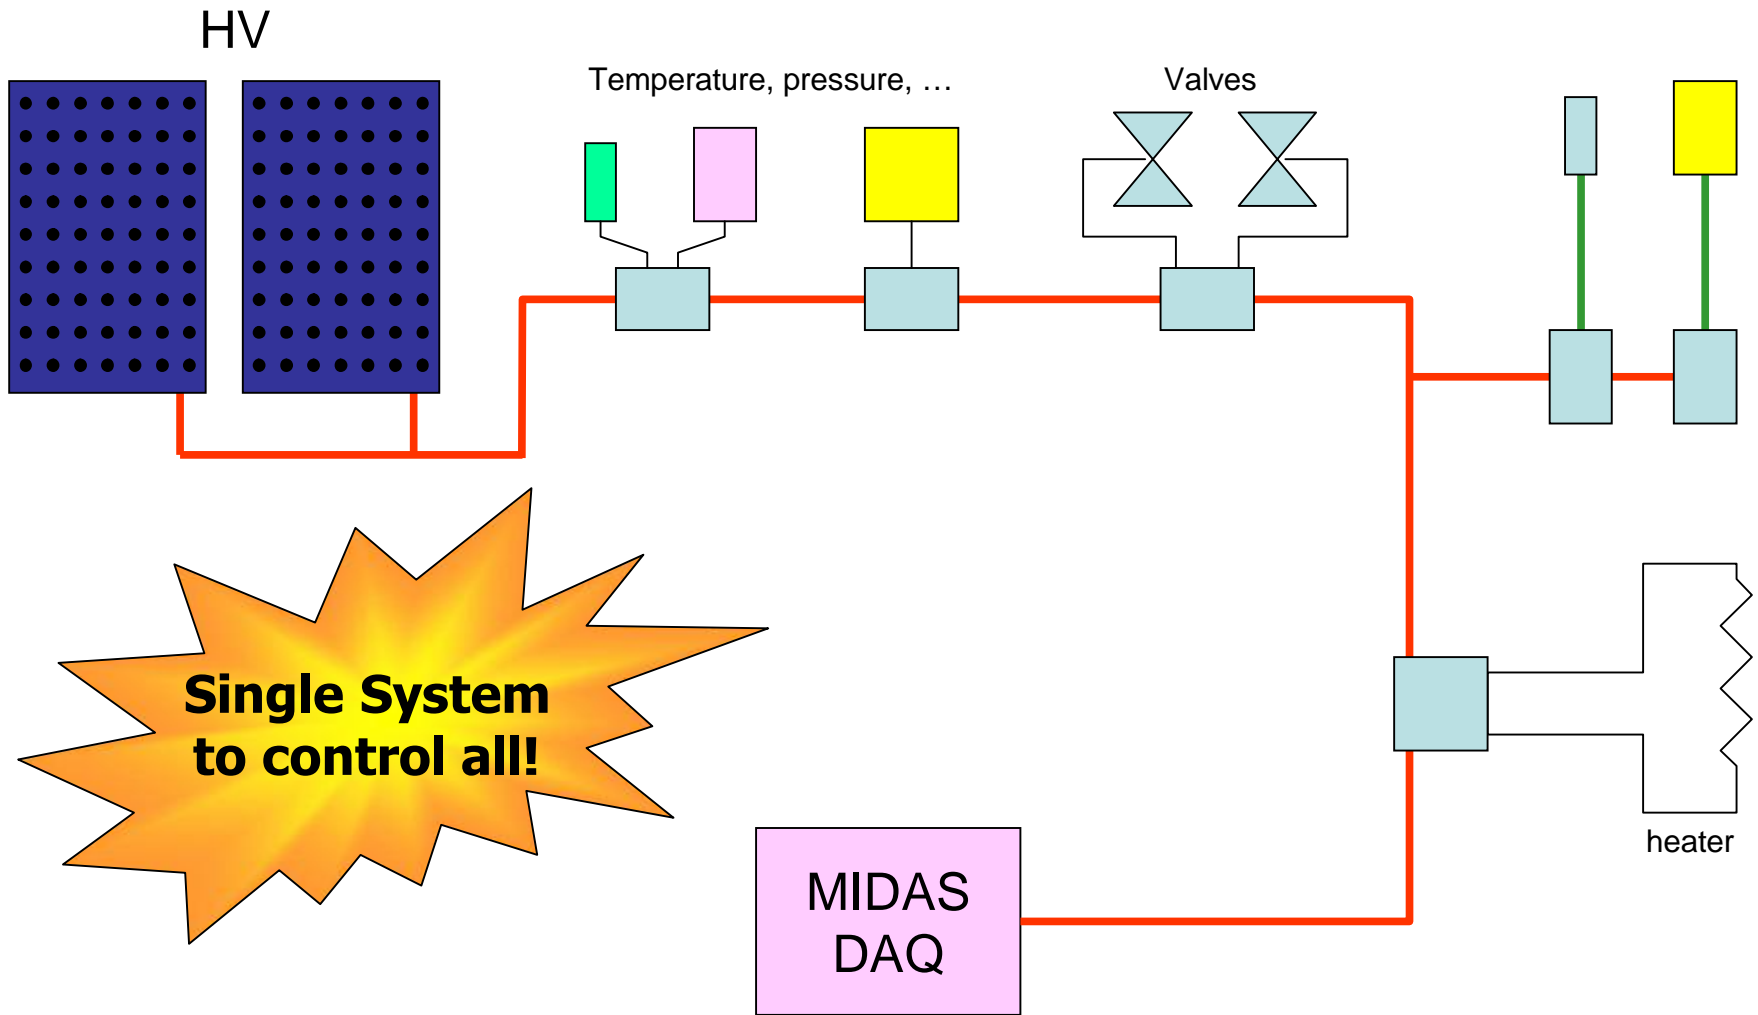

Cooling water

- 10 secondary circuits

Traditional Slow Control

Single Slow Control System

A long and winding road

Various demands in an experiment are pretty demanding
(inhomogeneity, stability, ease of use)

It took finally three iterations to make a good system

- Many lessons learned
- Some unusable hardware produced
- Project started in 2001, now (kind of) finished

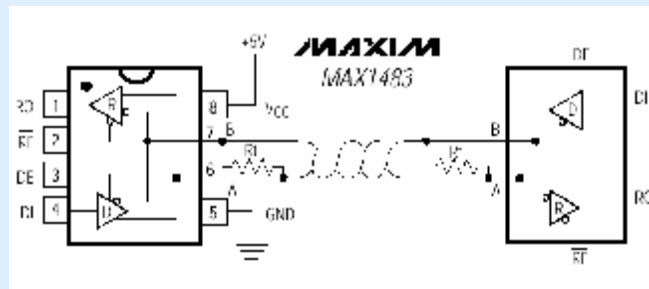

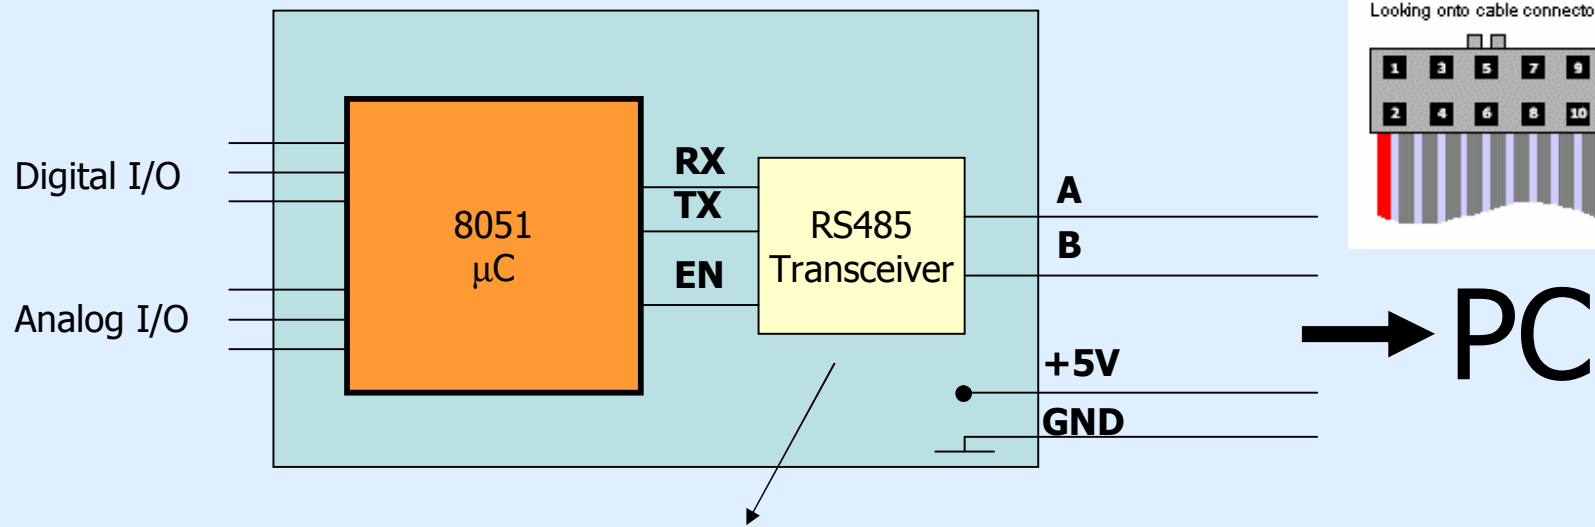

We have now a very good and flexible system

- Used in MEG, μ SR, SLS, PEN at PSI
- Can be extended very easily

First version MSCB system

New generation of 8-bit microcontrollers with analog I/O
RS-485 communication of hundreds of meters

Up to 256 nodes in parallel connected to RS-485 bus

Huge variety of mixed signal microcontrollers

Part Number	MIPS (peak)	Flash Memory (bytes)	RAM (bytes)	Digital Port I/O Pins	Serial Buses	Internal Osc	ADC1	DAC	Temp Sensor	VREF	Other	Package
C8051F000	20	32 KB	256	32	UART, SMBus, SPI	±20%	12-bit, 8ch., 100ksps	12-bit, 2ch.	Y	Y	-	TQFP64

C8051F340	48	64 kB	5376	40	USB 2.0, 2 x UART, SMBus, SPI	±1.5%	10-bit, 17ch., 200ksps	-	Y	Y	-	TQFP48
C8051F410	50	32 KB	2304	24	UART, SMBus, SPI	±2%	12-bit, 24ch., 200ksps	12-bit, 2ch.	Y	Y	Volt Reg, RTC	LQFP32

Asynchronous 115 kBaud

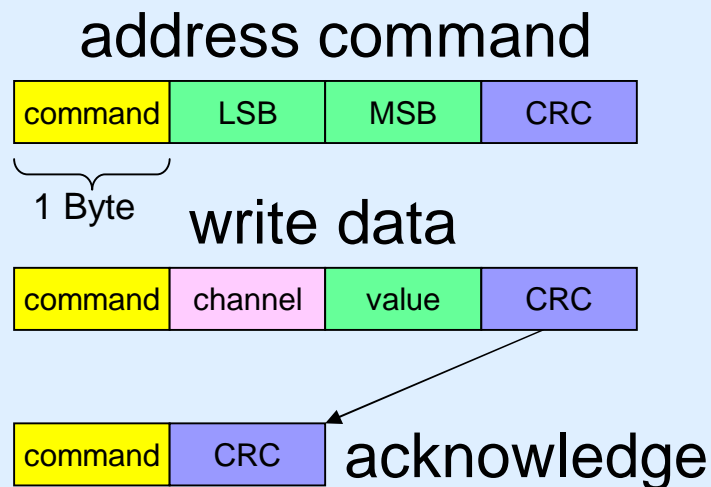

16-bit addressing (64k nodes), CRC-code, acknowledge

Concept of typed "network variables"

Optimized protocol: 300 reads/sec.

Firmware upgradeable over MSCB bus

Node programming

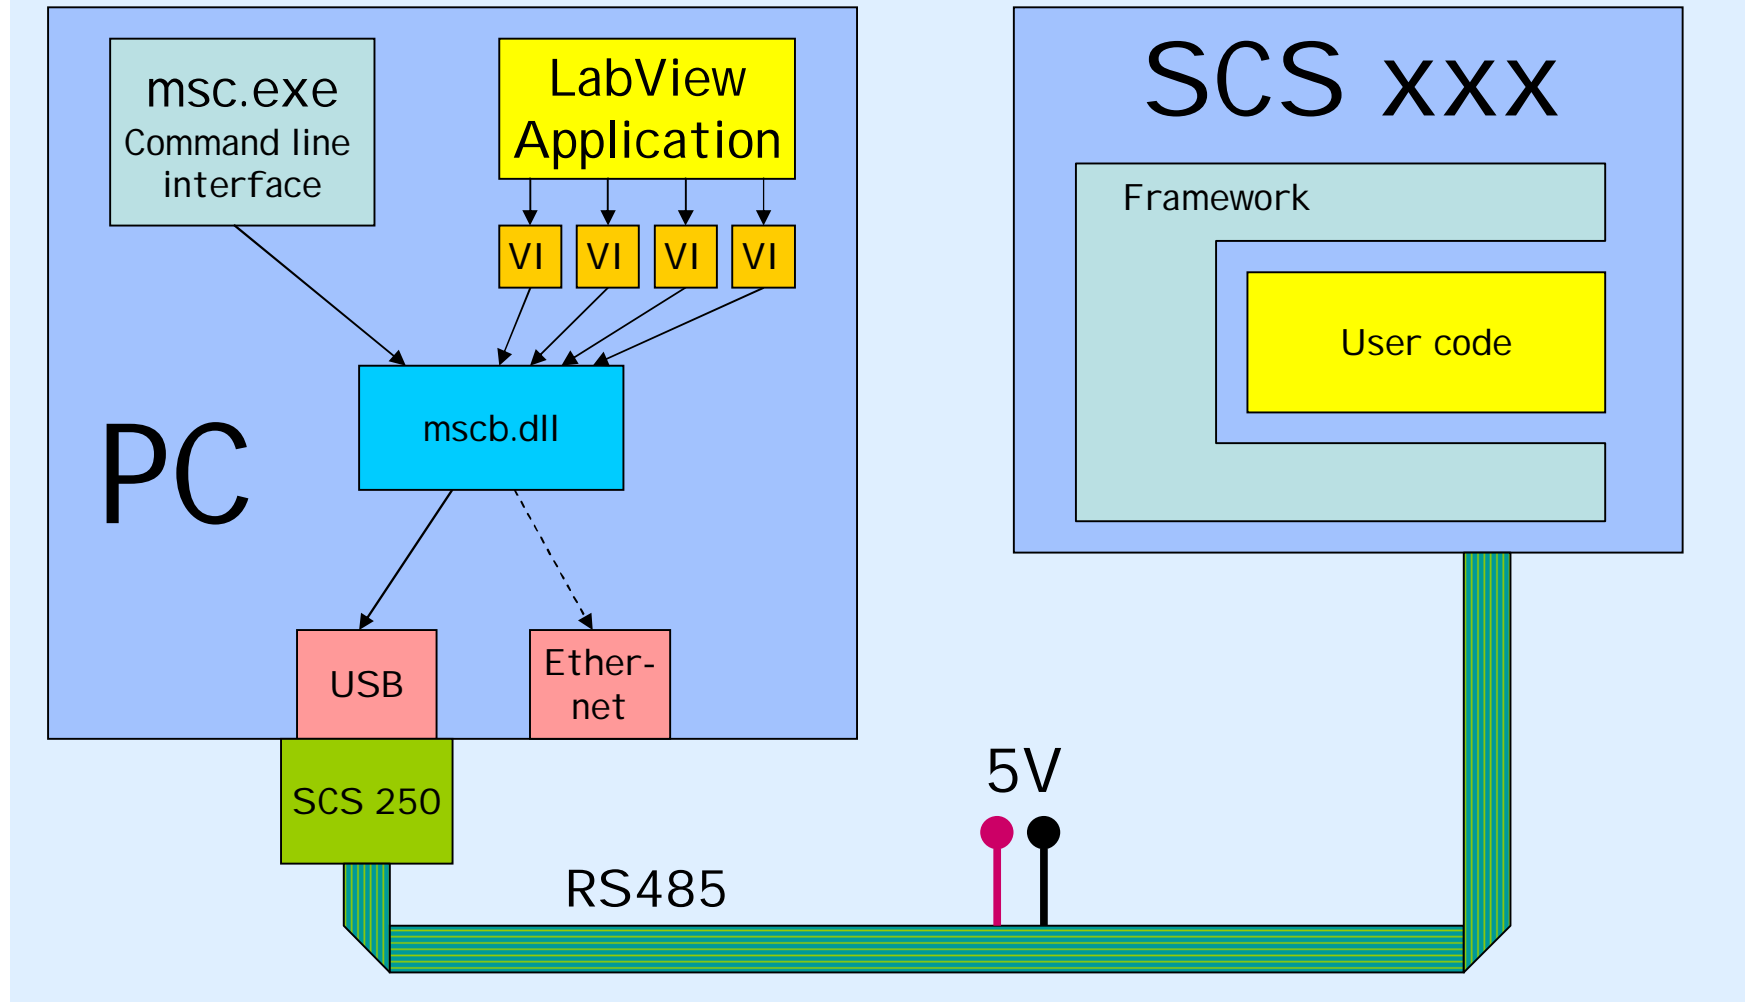

```

struct {
    float adc;
    float dac;
} user_data;

main()
{
    ...
    user_data.adc = read_adc(0);
    write_dac(user_data.dac);
    ...
}
  
```

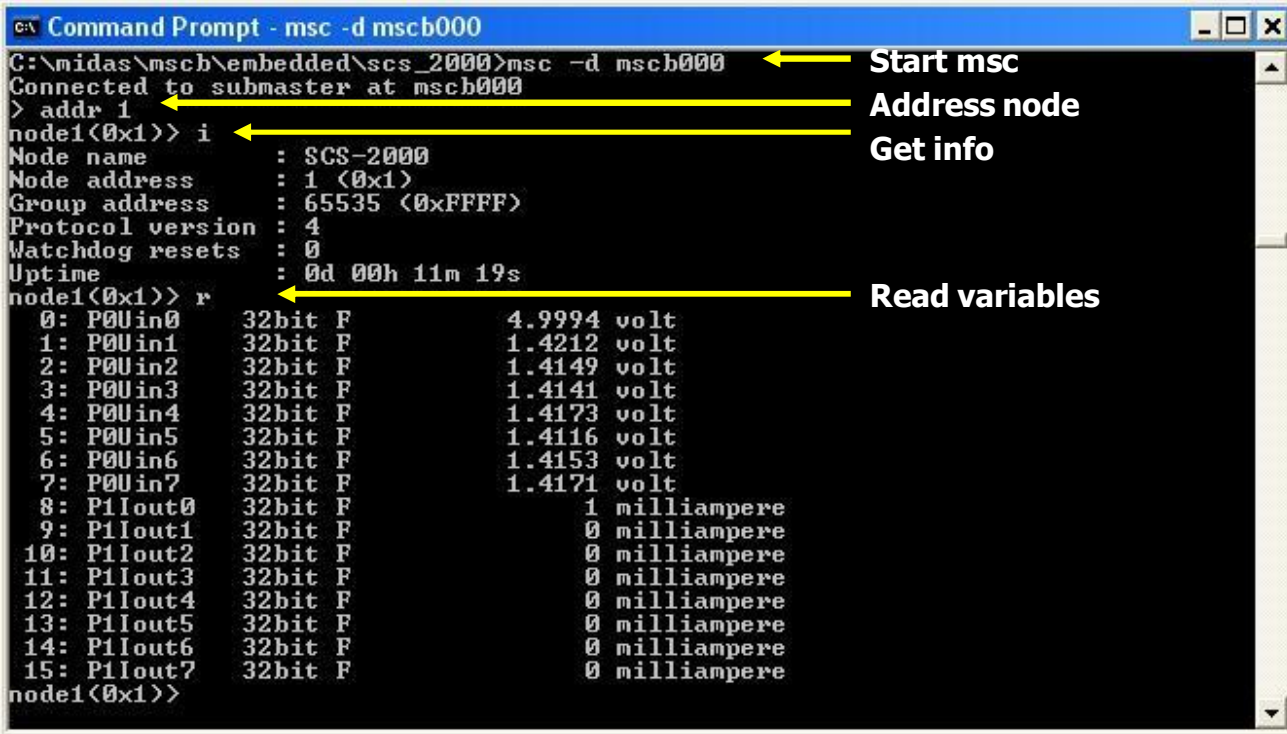

Easy application development due to powerful framework™ (MIDAS!)

MSCB Command Line Interface

Simple ASCII CLI under Windows and Linux as a human interface to the mscb C library

```

c:\ Command Prompt - msc -d mscb000
C:\midas\mscb\embedded\scs_2000>mscb -d mscb000
Connected to submaster at mscb000
> addr 1

```

← Start msc
 ← Address node
 ← Get info
 ← Read variables

First Version

3HE Card with piggy-back CPU
Various cards for digital and analog I/O

Problems with first version

System was stable and reliable, unless there were noisy environments

Low density (full slot for ~ 8 channels)

PC is always required for operation (MSCB only used as DAC/ADC)

- Labview sometimes crashes
- One PC had hard disk failure \rightarrow LHe reservoir evaporated
- Replacement laptop did Windows update over night \rightarrow LHe reservoir evaporated again **L**

No local display

Always crate needed

Difficult cabling (no outputs at back!)

Second MSCB Version

SCS-1000

LCD, buttons, screw terminals

Rack mounted and standalone (24V)

8 analog in, 2 analog out, 4 Relais
4 digital in

Local application software

Magnet Control

Standalone (non-PC) control of superconducting magnet

USB Submaster

USB submaster (SCS-250) replaced parallel port adapter. Drivers were written for Windows (difficult!) and Linux (easy but...)

5V/0.5A from USB can be used to power MSCB nodes over bus

Problems second version

Limited number of IOs

Microcontroller directly coupled to IOs

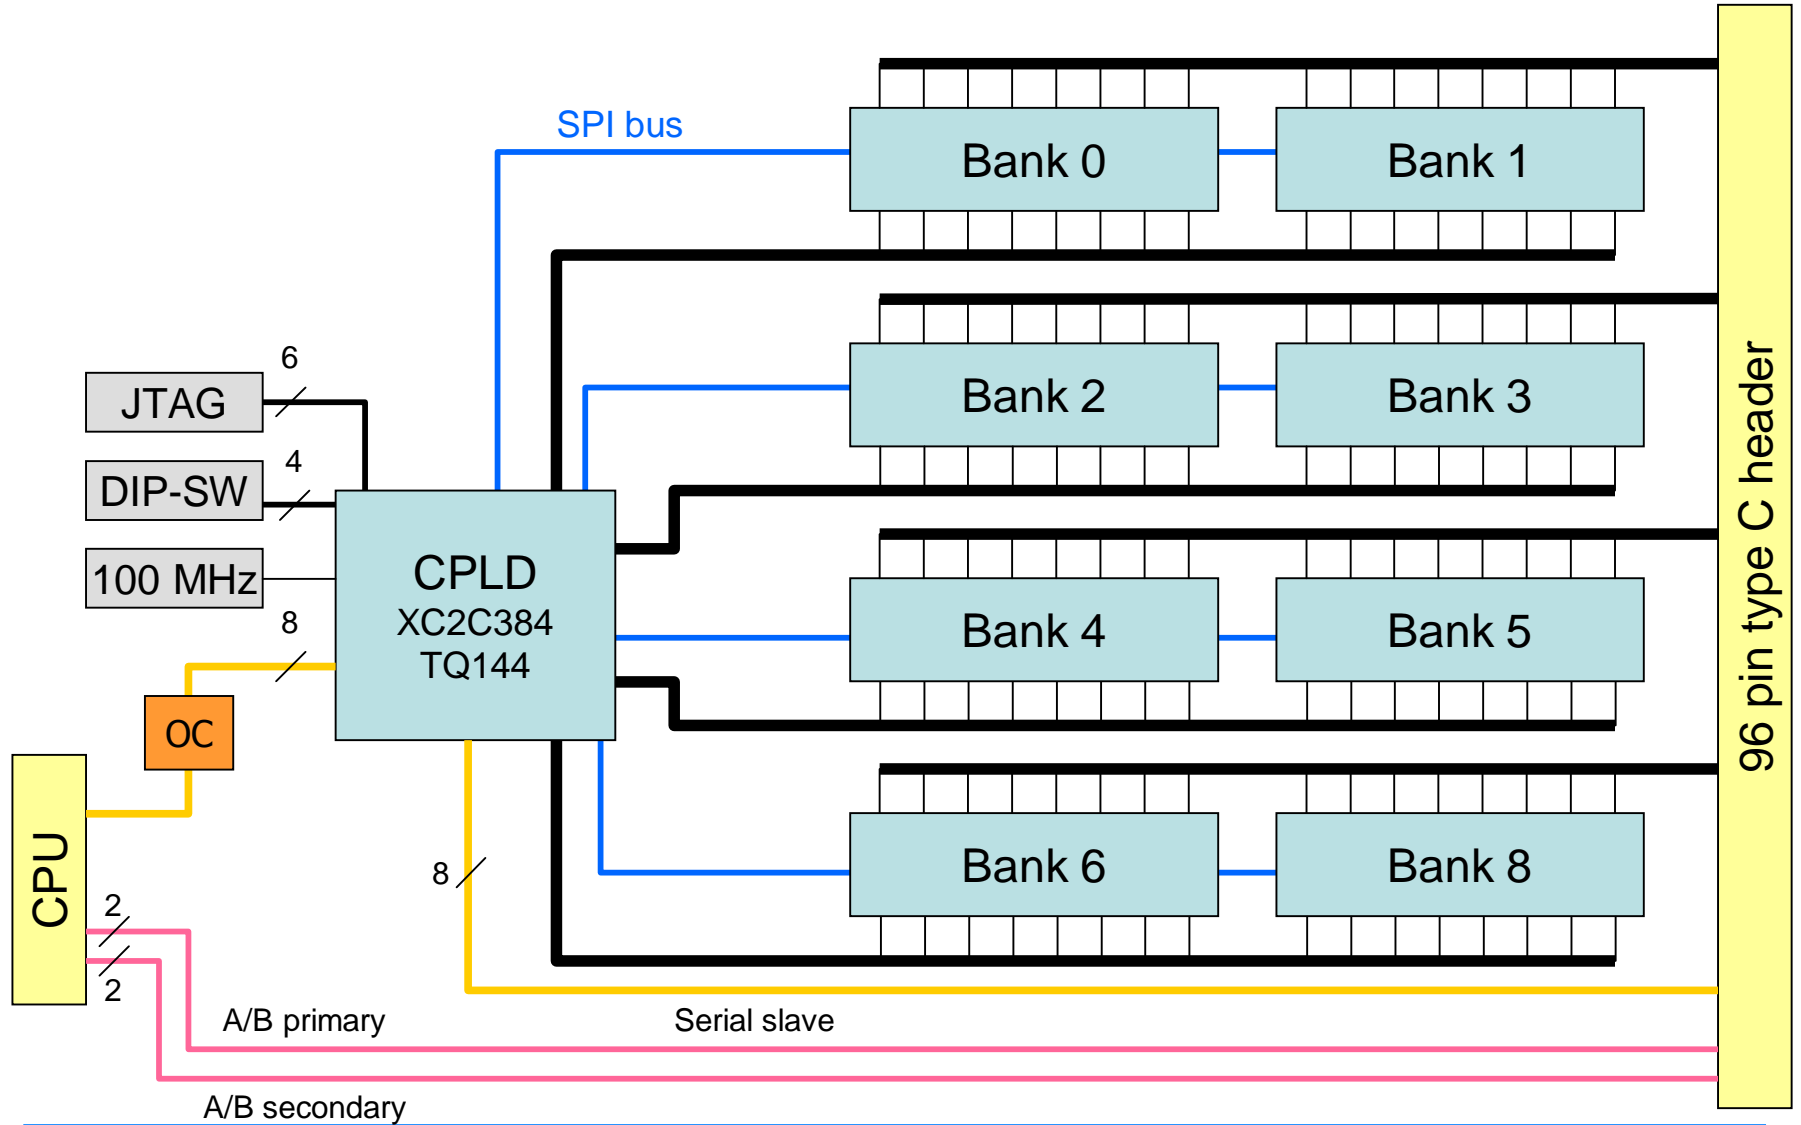

Outputs go high during reboot/firmware upgrade

DACs go to zero during reboot/firmware upgrade

No operation when CPU crashes

(optional) PC need physical connection to MSCB bus via USB

New concept

Third version

SCS-2000

SCS-2000 Advantages

Flexible IO, 8 banks with 8 IOs each

Simple IO boards

CPU optically decoupled

Serial slave bus for daisy-chaining 16 SCS-2000

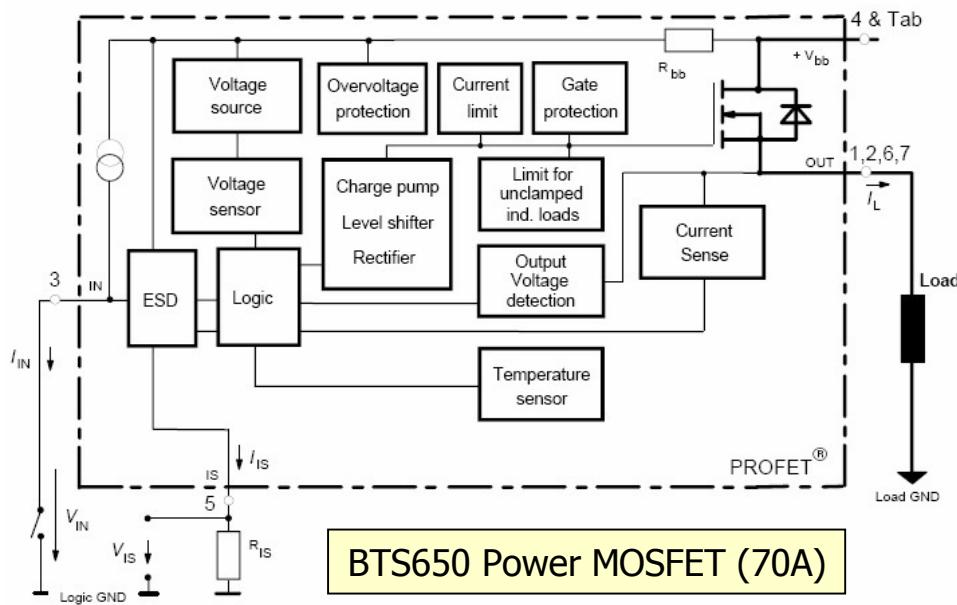

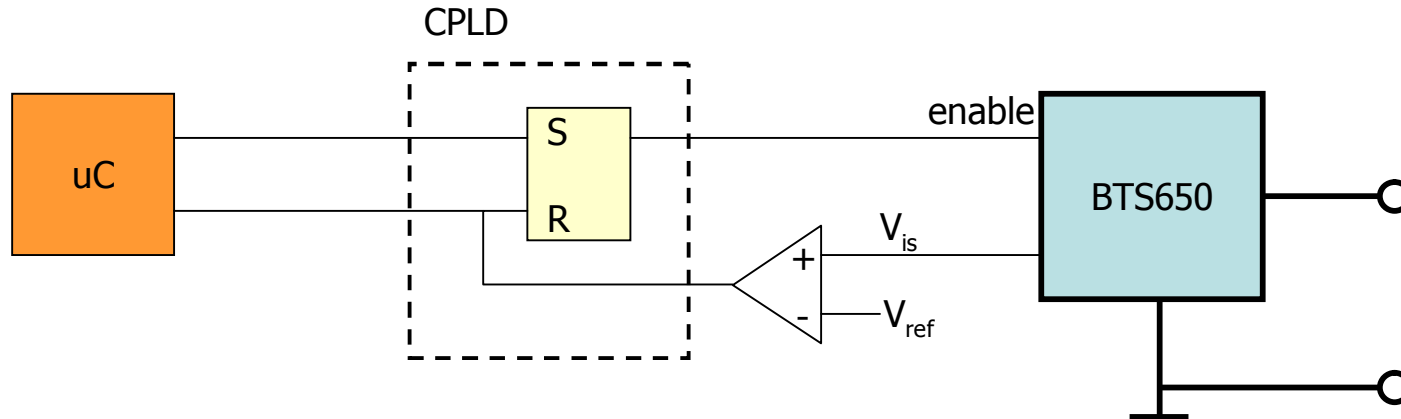

CPLD keeps state during reboot

CPLD can do low-level tasks independent of CPU

CPLD can do fast tasks (100 MHz clock)

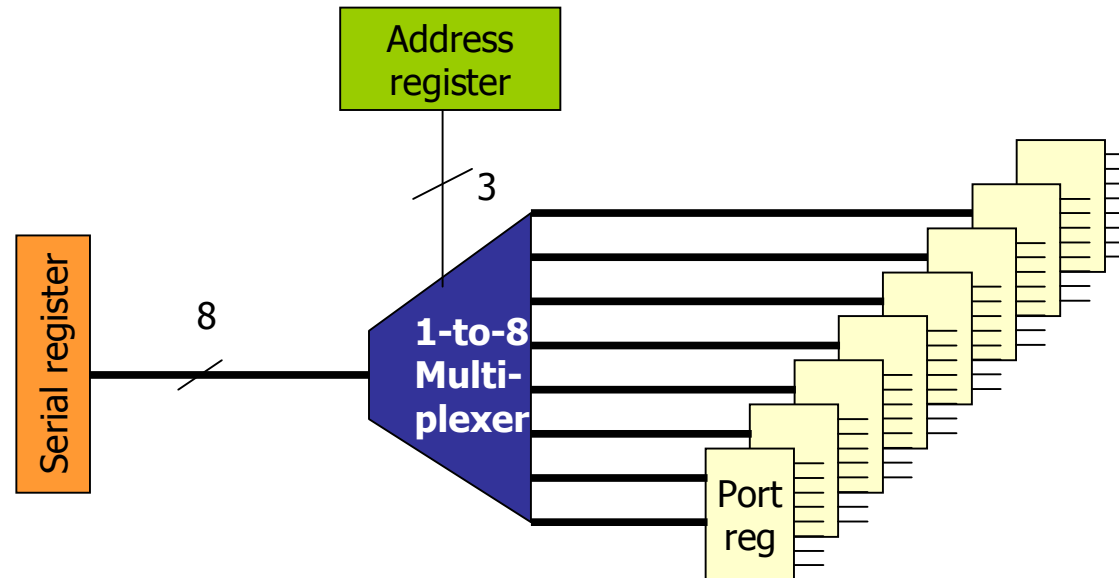

Soft-fuse

Soft-fuse

**No blown fuses
in the middle
of the night
any more!**

CPLD programming with VHDL

```

type type_port_reg is array (7 downto 0) of std_logic_vector(7 downto 0);
signal port_reg : type_port_reg;
...
port_reg(CONV_INTEGER(addr_reg)) <= ser_reg;
  
```

Use VHDL even for CPLD programming !

SCS-2000 IO Cards

EEPROM

Experimental Board

Debug Board

3.3V/5V
8 In/Out

24V 2A
8 Out

4 Relais

0-20mA
8 Out

-10...+10V
8 Out

-10...+10V
0..2.5V
0..20mA
8x24bit In

0...10nF
0...1uF
4 In

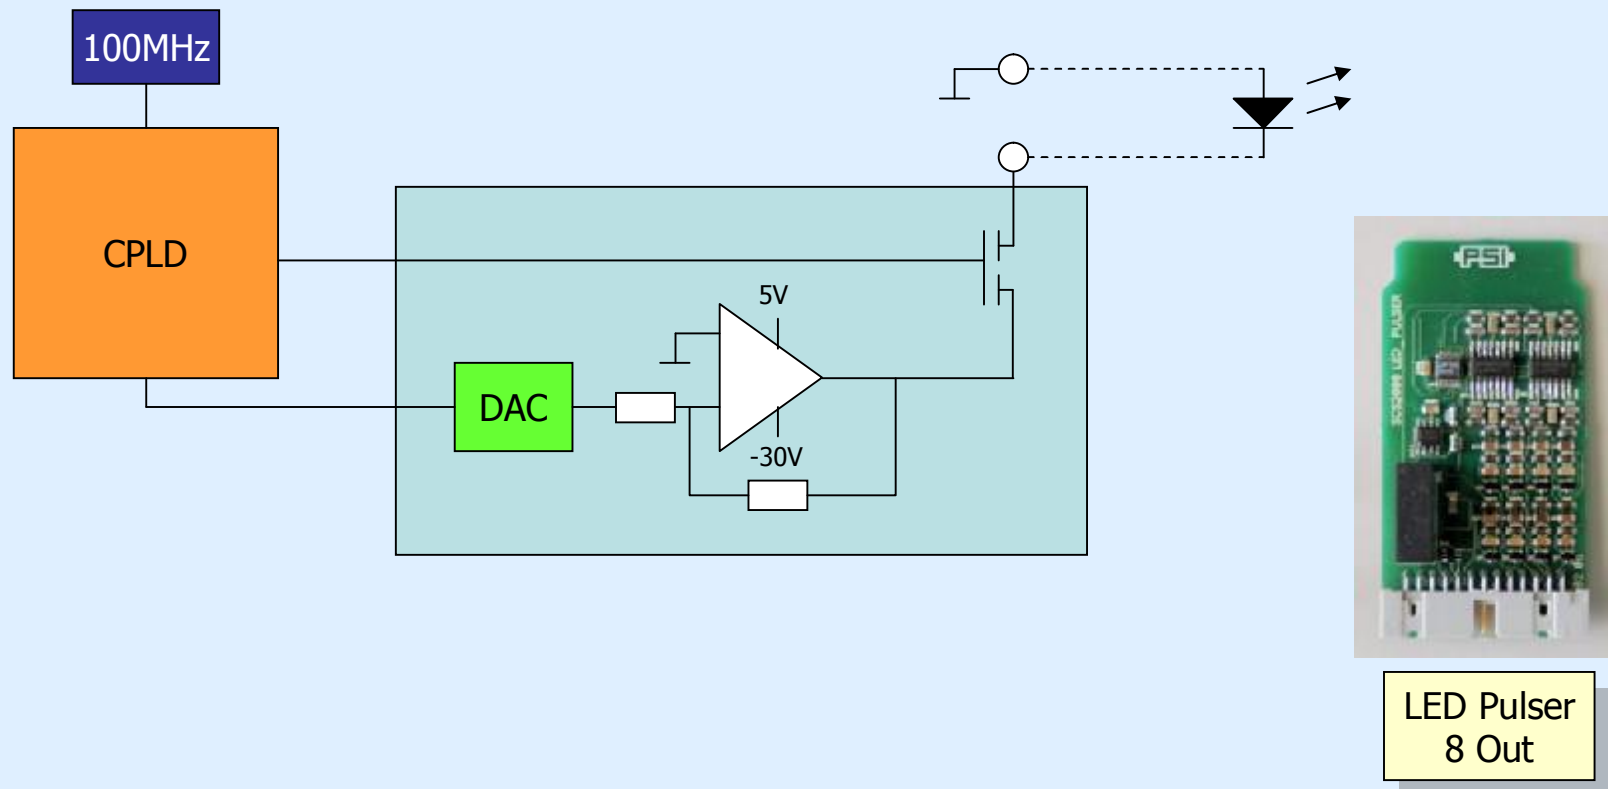

Opt.-Coupler
4 Out

LED pulser

Needed: LED pulser 0...-30V @ 50 Ohm, 30ns width, 100Hz – 1MHz repetition rate, triggerable

LED pulser box

Single SCS-2000 fits 40 channels LED pulser
Either stand-alone operation or MSCB controlled

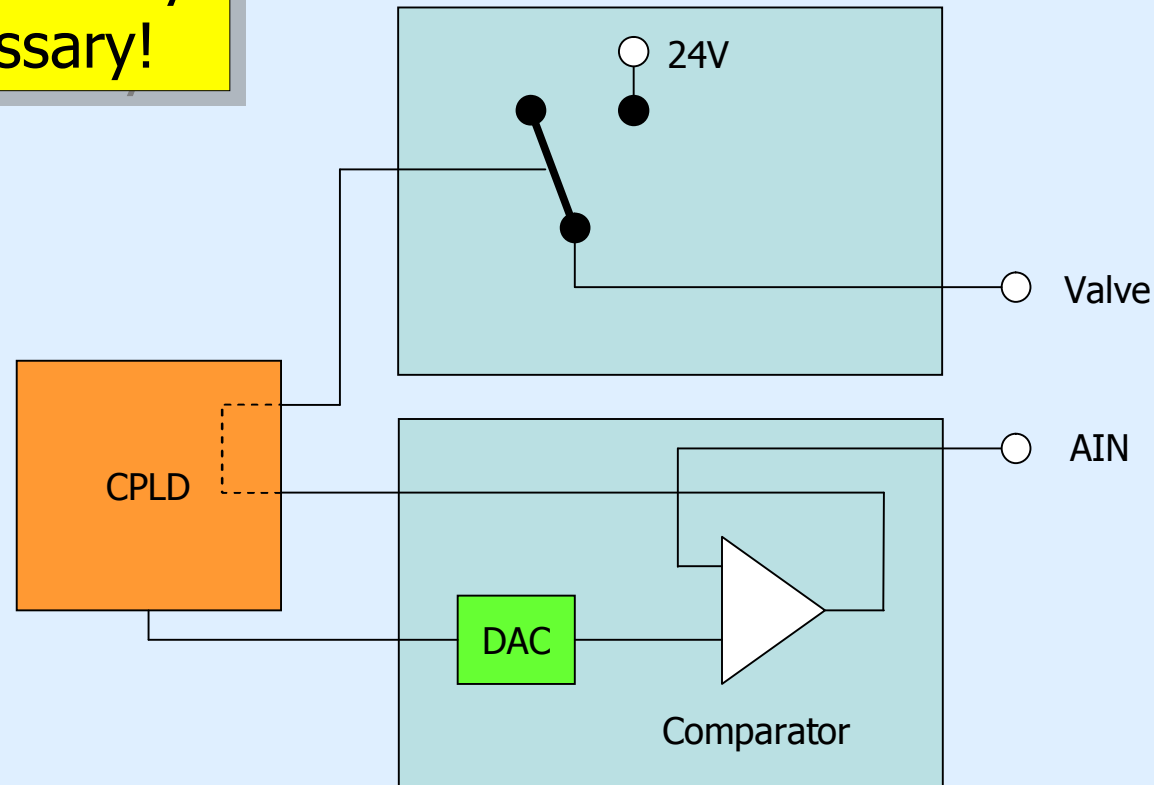

Example for low level control

CPLD can for example switch valve if pressure gets too high

No μC activity necessary!

What else?

Other MSCB solutions used at PSI

SCS-260 Ethernet Submaster

Uses C8051F121 microcontroller @ 50 MHz

Cirrus CS8900A 10Base-T MAC chip

MICRONET TCP/IP stack from CMX

- ~6k CAD
- Full source code
- DHCP, TCP, UDP, HTTP

Had to request MAC addresses

Boots in 100ms

Replaces more and more USB
interface

SCS-260 as a beacon

ADC on μC measures magnet current and distributes it through IP multicasts

Multicasts are better than broadcasts (distributed only on request)

Used now also for accelerator current status

```

pc5082.psi.ch - PuTTY
[ritt@pc5082 scs_260_dev]$ ./cobra_current
Multicast group: 239.208.0.2

23:51:22 - COMET 1: 0.00 COMET 2: 0.00
  
```

Interface nodes

Some experiment hardware has own controllers → need interfaces

Parallel (Centronics), RS-232 and GPIB adapter

Work either string oriented or with local protocol handlers

String oriented:

PC has to run protocol, MSCB node is device independent

Local protocol handler:

MSCB node runs protocol, PC is device independent

Crate controller requirements

VME crates have status bits and control bits (VME reset)

Current solution: CAN node (1000 CAD/crate + PC)

Also need

temperature
(currently not
implemented)

Solution with MSCB

Put μ C+RS-485+Temp. Sensor in 9-pin Sub-D connector

Power from MSCB bus, interfaced with Ethernet submaster

Took 1 day for engineer to design and couple of hours for me to program

Costs 30 CAD

It fits!

SLS department installs this for ~100 crates

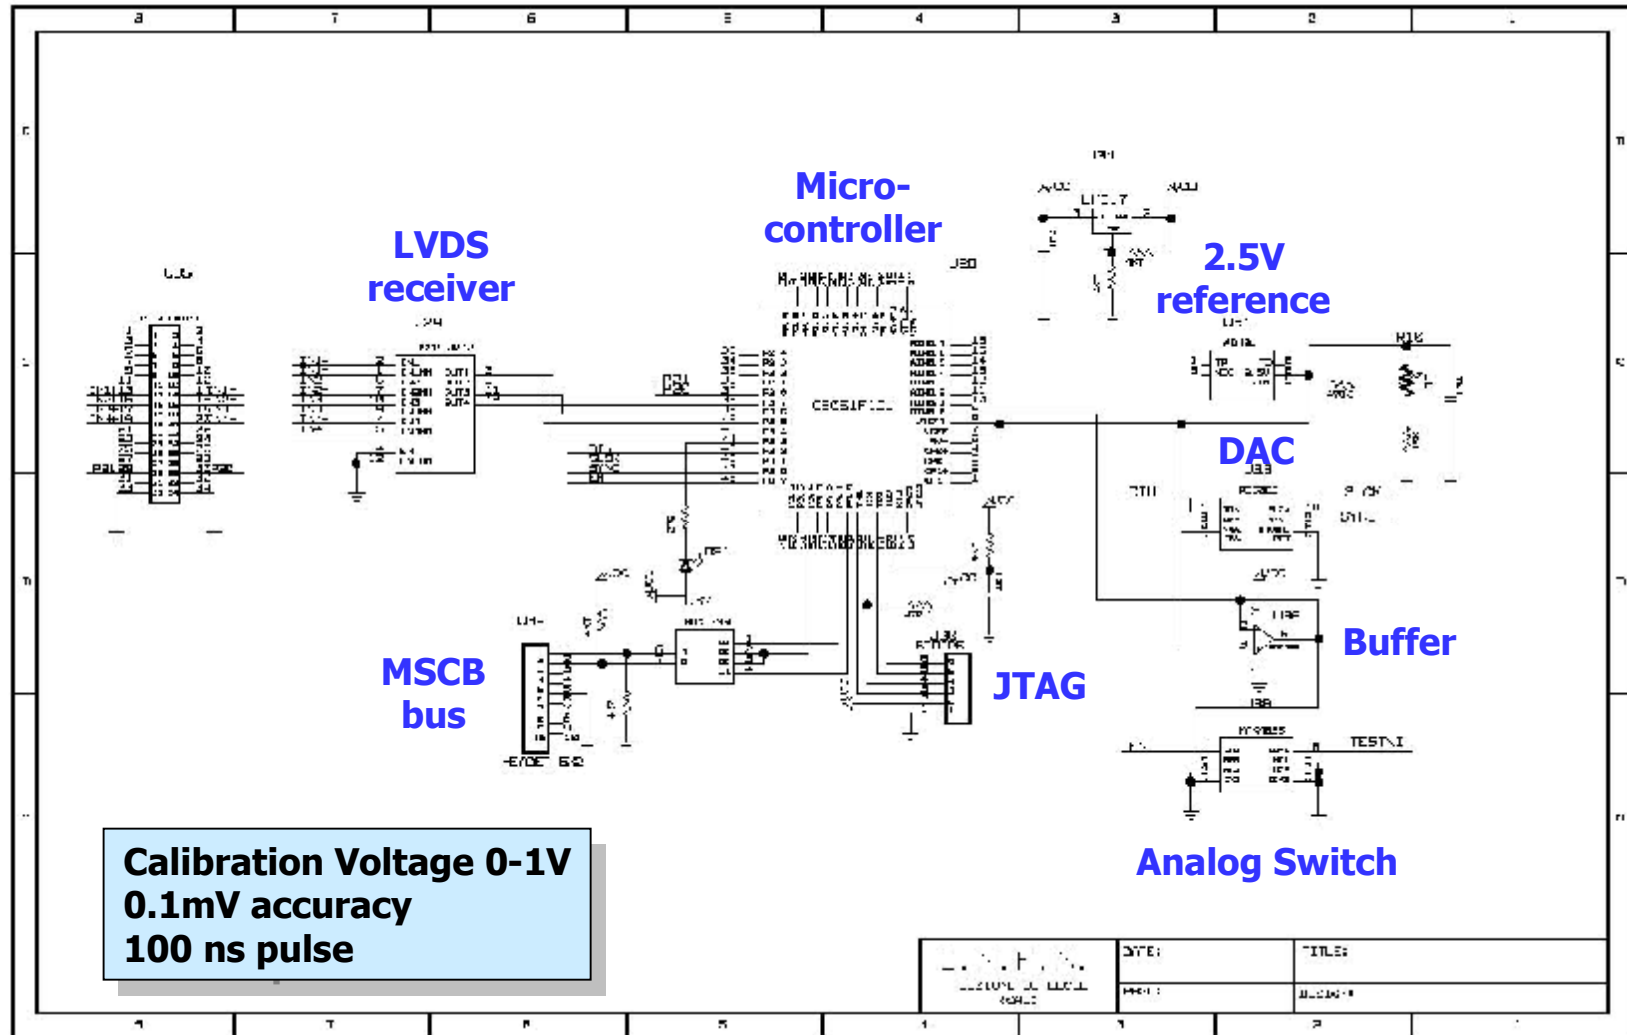

Piggy-back Controller

PSI-developed Constant-Fraction-Discriminator needed user interface to set delay lines and fractions as well as remote control

Precision Voltage Source

PCB Signal Splitter

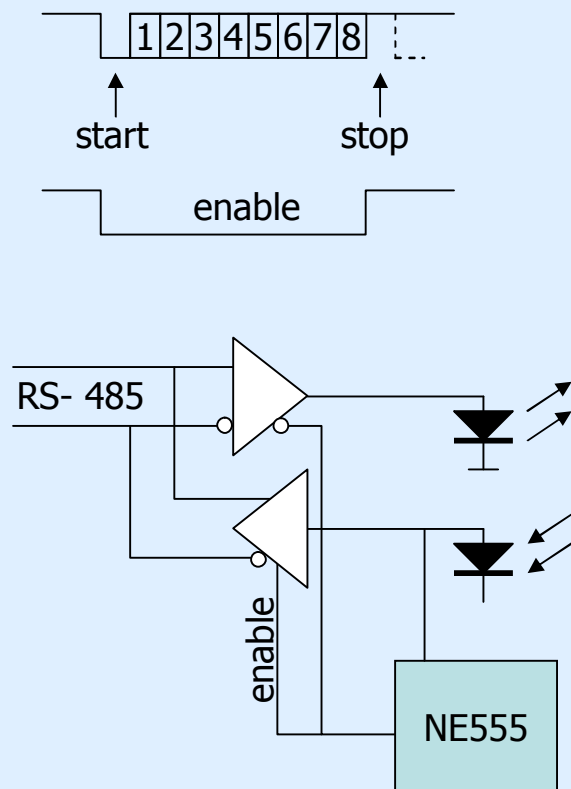

Trigger Bus **Micro-Controller** **MSCB connector**

Optical transceiver for $>5\text{kV}$ insulation, necessary for electrostatic separator (200kV)

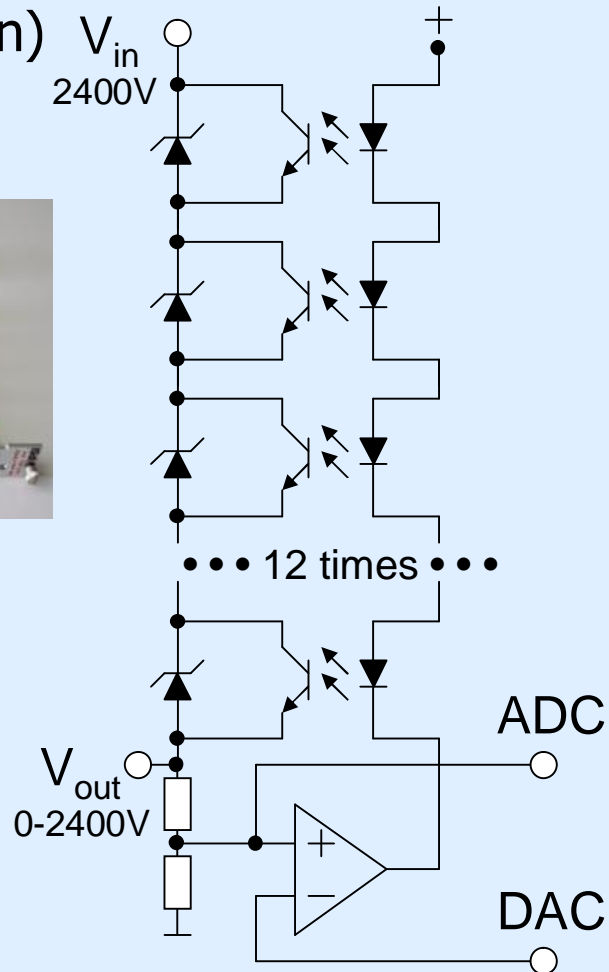

High Voltage Regulators

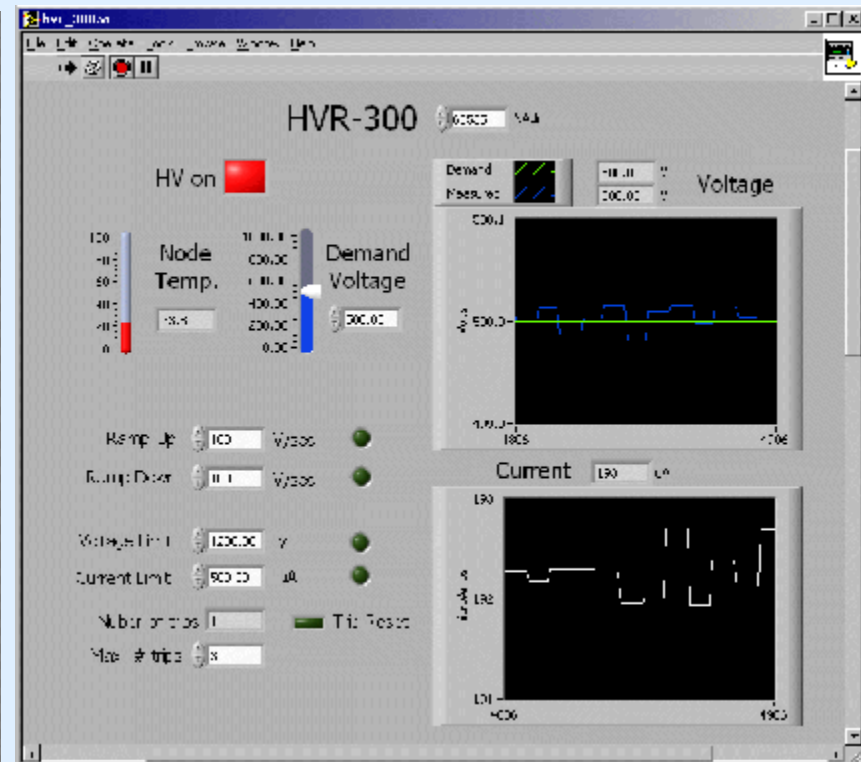

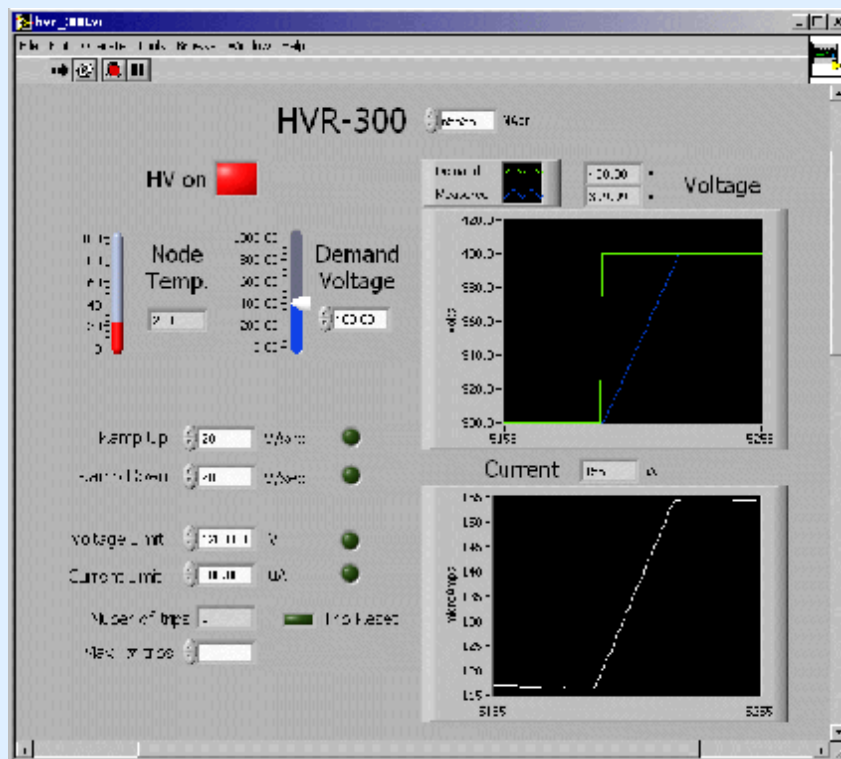

Very high accuracy ($\sim 10\text{mV}$ @ 1000V)

Low cost (~ 50 CAD/chn)

Accuracy – ramping – current trip – trip reset

Software aspects

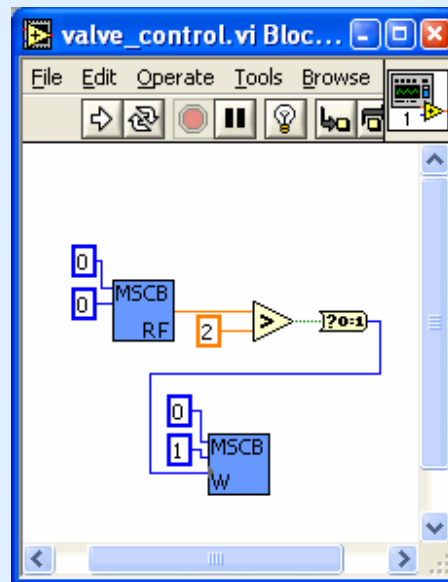

Three possibilities for control loops

```

adc0 = mscb_read(0, 0);
if (adc0 > 2.0)
    mscb_write(0, 1, 1);
else
    mscb_write(0, 1, 0);
  
```

PC (e.g. Midas Front-End)

PC (LabView)

```

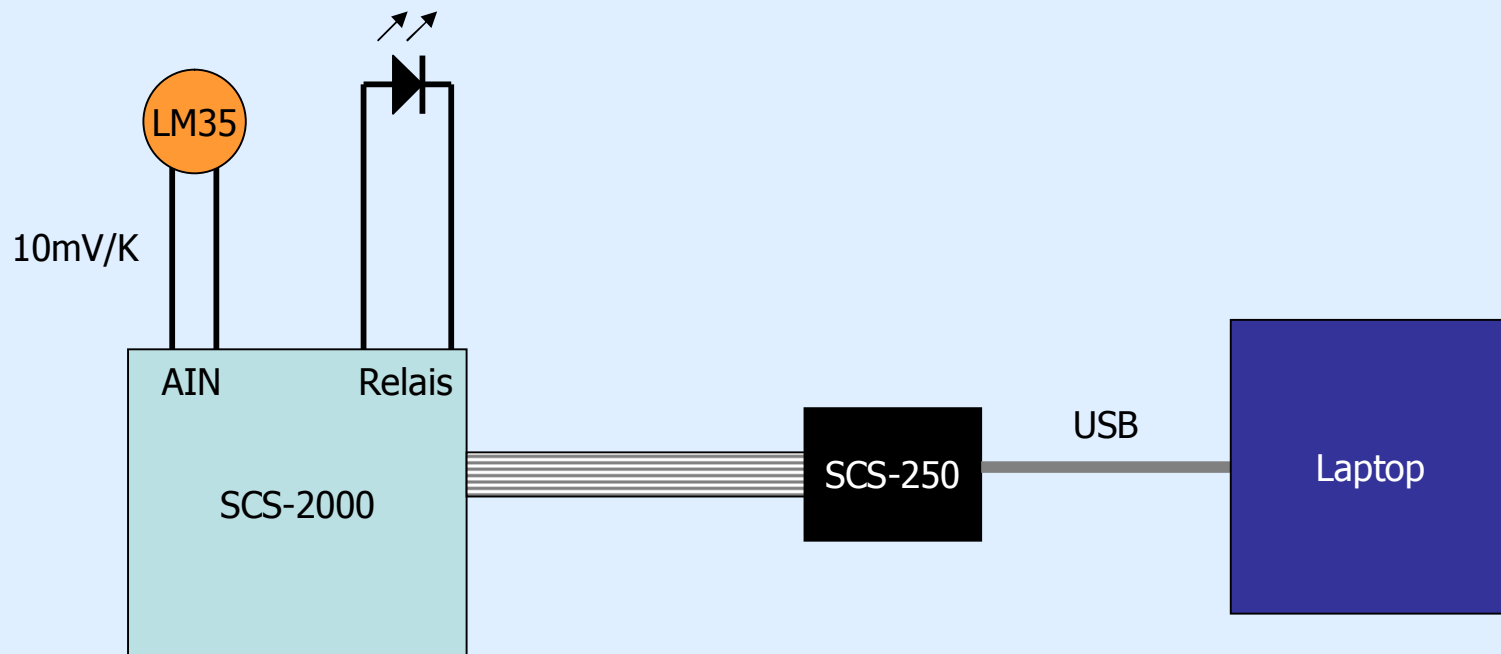

user_data.adc0 = adc_read(0);
if (user_data.adc0 > 2.0)
    user_data.valve0 = 1;
else
    user_data.valve0 = 0;

user_write(0);
  
```

MSCB node

Simple demo to read a temperature and to control a relays

Which topology should I use?

	PC (Front-End)	Labview	Microcontroller
pros	Can be easily integrated into existing Midas Front-End Well known debugging environment Access via MIDAS slow control system	Easy to learn "Automatic" documentation Quick getting started	No PC required Very stable Access via MIDAS slow control system
cons	Needs PC-MSCB connection	Instability Not suited from complex tasks Costs Needs PC-MSCB connection No (easy) remote access	Limited resources on uC Requires uC development environment (\$\$)

LabView experience

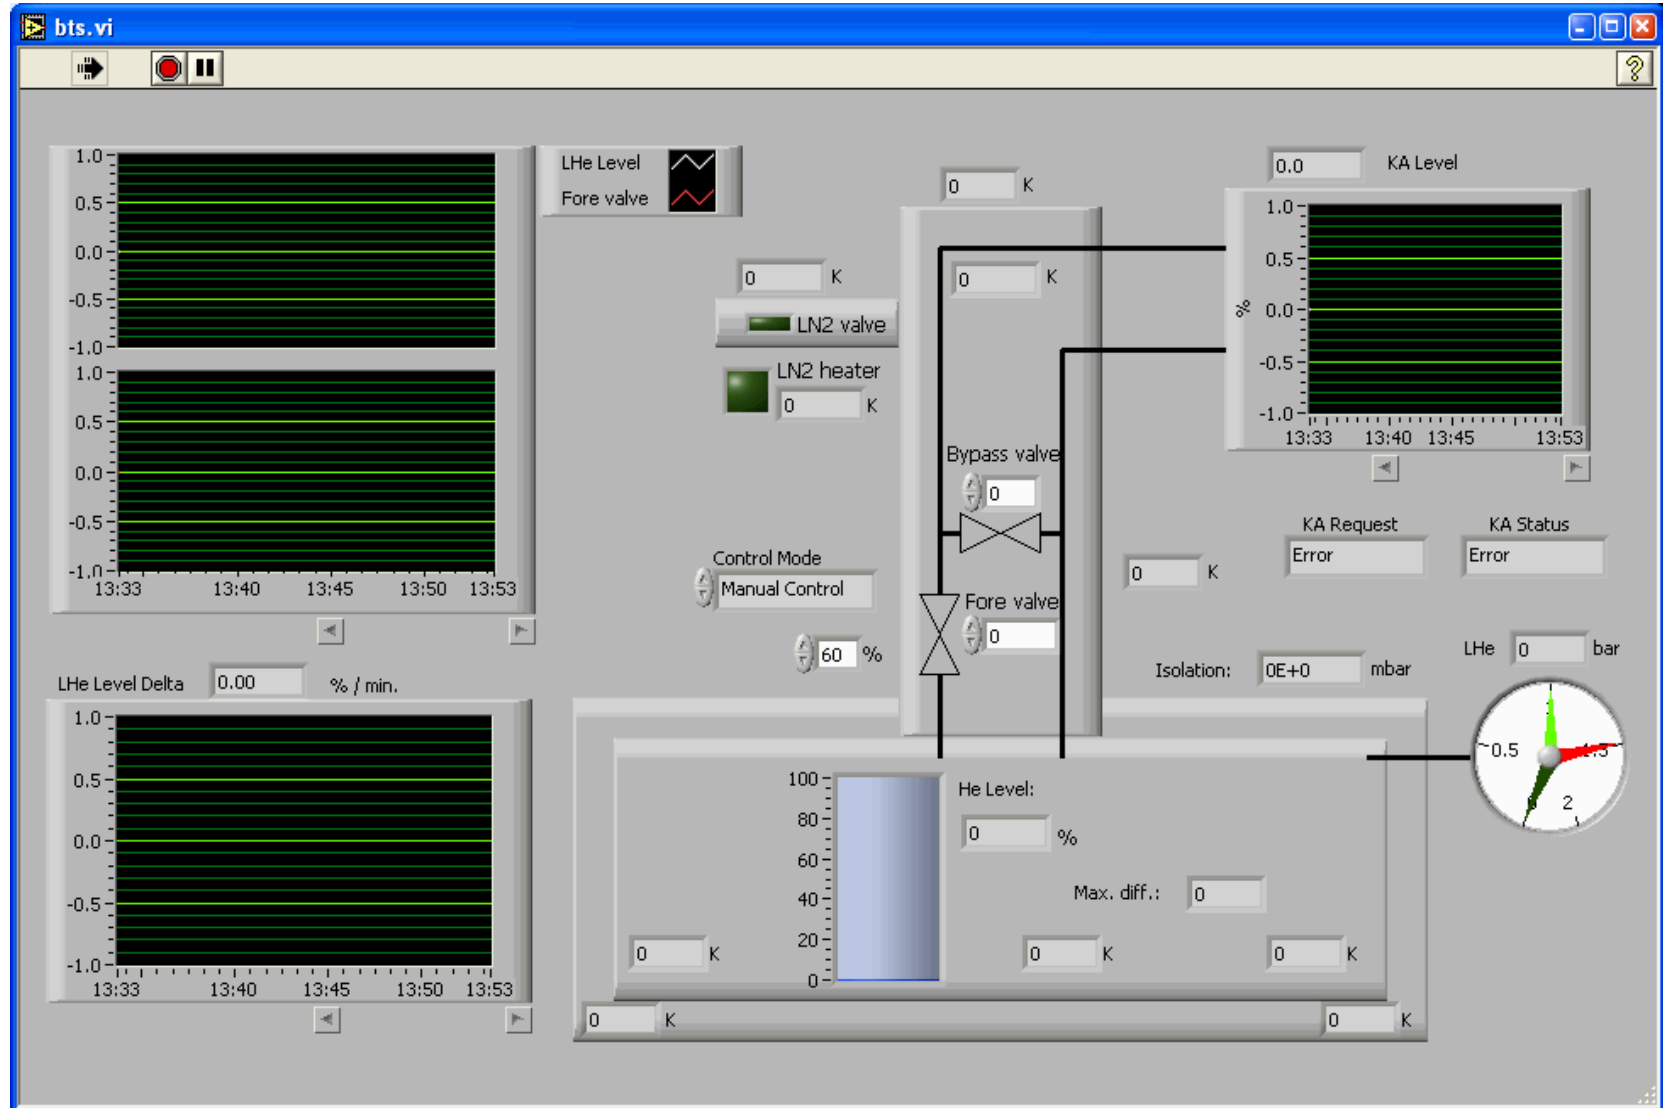

LabView very well suited to get quickly started and to develop control algorithms and visualization

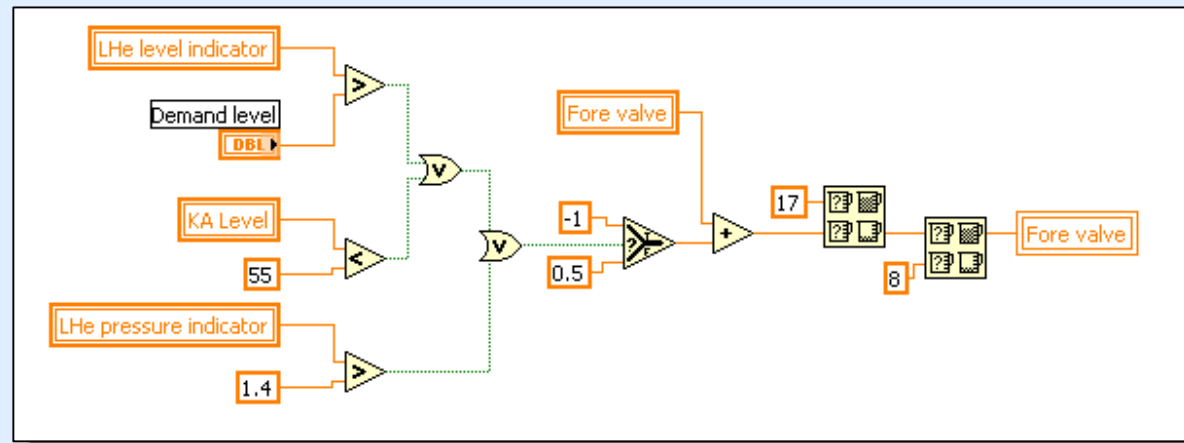

For complex applications, LabView becomes cumbersome

The “golden” road

- Development under LabView
- Implementation in μ C
- Visualization in MIDAS slow control system

Transition LabView → uC/Midas

↓

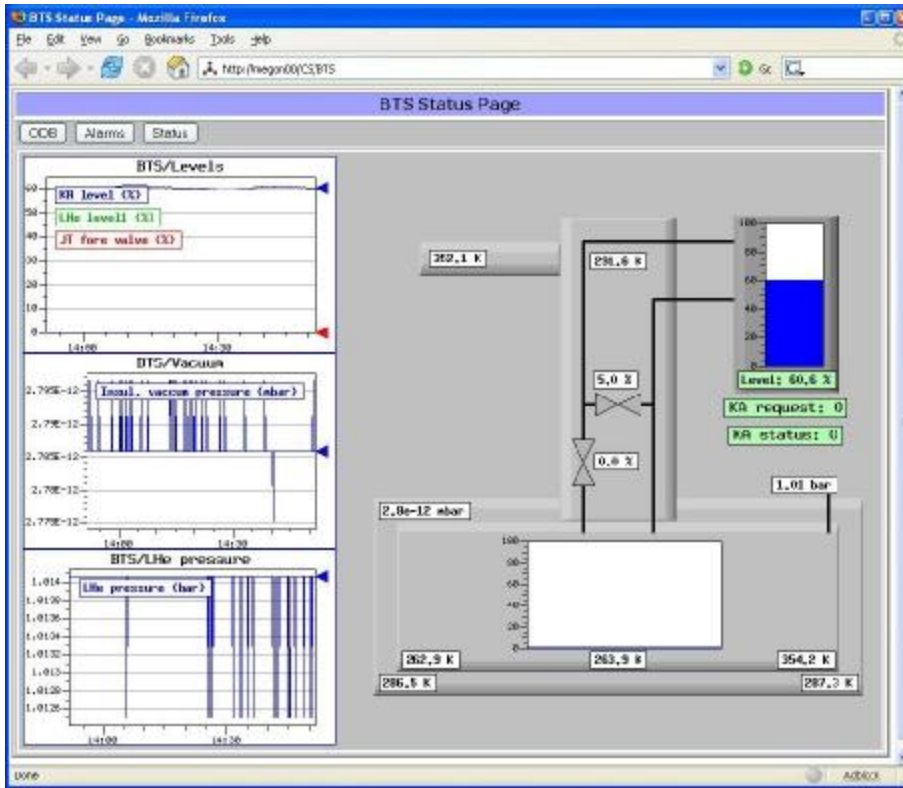

```

v = user_data.jt_forerun_valve;
if (user_data.lhe_level1 > user_data.lhe_demand ||
    user_data.ka_level < 55 || user_data.lhe_bar > 1.4)
    v = v - 1;
else
    v = v + 0.5;

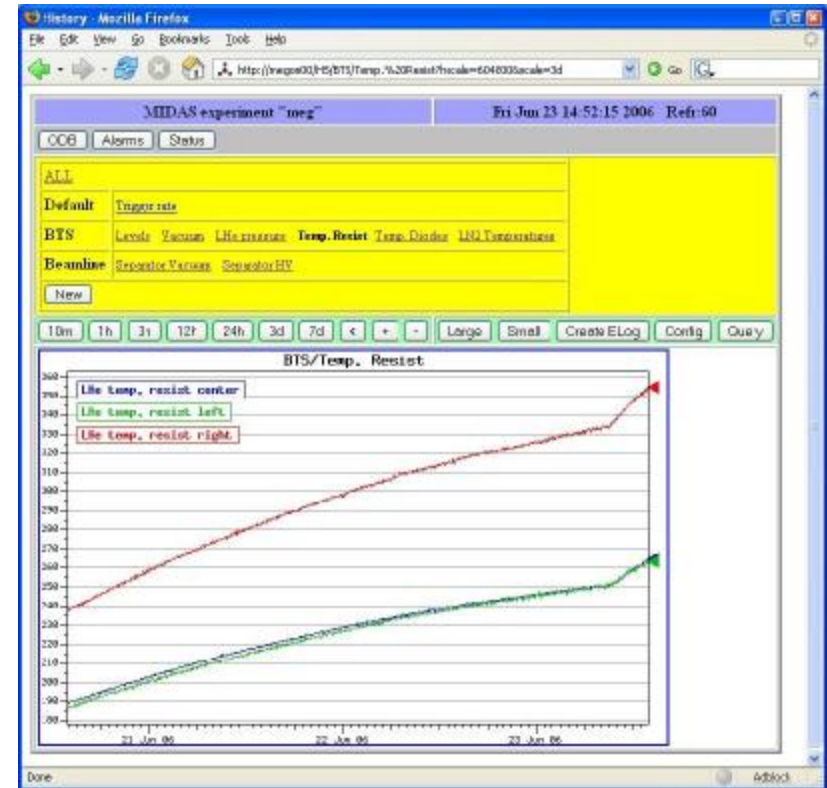

if (v > 17)
    v = 17;
if (v < 8)
    v = 8;

user_data.jt_forerun_valve = v;
user_write(14);
  
```

MIDAS Custom Pages & History

MIDAS "custom" page

MIDAS history

Would I do it again?

- Money-wise: 5 years development (2MY), saved 200k CAD in HV and 100k CAD for experiment → **NO**
- Flexibility: Now takes a couple of days to develop new I/O card → **YES**

Would I choose 8051 μ C again or 32-bit processor (ARM7)?

- 8 bit power @ 100 MHz enough for regulations, fast control (20 ns port access time)
- 256 Bytes RAM not enough, need at least 1kB + 32kB flash
- On-chip ADC/DAC not enough for high precision applications
- Development environment very good (In-circuit debugging, flash download via JTAG) → **YES**

Choose again RS-485 over CAN?

- MSCB protocol is very simple and optimized (like firmware upgradeable over network) → can debug with oscilloscope
- MSCB protocol can be extended
- Run currently at 115kBaud (good for 500m w/o termination)
- Very nice opto-decoupled RS-485 transceiver (ADM2486)
- C8051F121 @ 100 MHz should go to 2 MBit
- Drawback: RS-485 is single master, while CAN has MAC layer

Where do we stand now?

After all hardware runs nicely, we have to monitor it!

ODB hot-link update
